

Purpose

This SOP guides the regional test coordinator through executing one complete performance test run in the QMA Test App, attaching evidence, saving progress, and sending the results CSV to the QA lead.

Before you start

- ✓ Browser open at https://albertof-fk.github.io/qma-perf-test/QMA_Performance_Test_App%20FK.html
- ✓ Sandbox URL for your platform (Veeva Vault or IQVIA SmartSolve) ready
- ✓ Test files downloaded from Test Assets section: 1 MB · 10 MB · 100 MB
- ✓ Stopwatch app open on your phone or second screen
- ✓ Screenshot tool ready (Windows: Win+Shift+S · Mac: Cmd+Shift+4)

Step-by-step execution

1 Open the app and identify yourself

Click **Execute Test** in the left sidebar. Fill in: Full Name, Email, Region, Country, Network Type. Your initials will appear in the bottom-left chip.

2 Select platform and file size

Click the platform card (**Veeva Vault** or **IQVIA SmartSolve**). Select the file size to test (start with 1 MB). Enter the sandbox URL in the Environment URL field. The Network Test panel (Step 7) will appear automatically.

3 Upload Run 1 — start the stopwatch

Open the sandbox in a new tab. Navigate to the upload area. Press **Start** on the app timer (or use your phone stopwatch). Begin uploading the test file. Press **Stop** when the upload completes and the page confirms success. Enter the time in seconds in **Upload Run 1**.

4 Upload Runs 2 and 3

Repeat the upload two more times. Enter times in Run 2 and Run 3. The app calculates the average automatically.

5 Download Runs 1, 2, 3

Download the same file from the sandbox three times, timing each one. Enter times in Download Run 1, 2, 3. Average calculated automatically.

6 Take screenshots as evidence

Take a screenshot after each completed upload and download showing: (a) the sandbox success confirmation, (b) the timer reading. Save them as: *Region_Platform_FileSize_Run1_Upload.png* etc. You will attach them in the next step.

7 Run automatic Network Tests

In the right column, click **Run All Network Tests**. The app measures latency, TTFB, jitter, throughput, and parallel degradation automatically. Wait ~20 seconds for the tests to complete. A green or red verdict appears.

8 Log errors and observations

In Step 6 of the form, describe any errors, timeouts, or unusual behaviour. In General Observations, note network quality and anything the data does not capture.

Submit the result

Click **Submit Results** (top right). Review the summary in the modal. Click **Confirm & Submit**. The result is saved to JSONBin immediately. The app resets — you can run the next file size or platform.

Attaching evidence screenshots

After submitting, upload your screenshots to the SharePoint folder: **QMA_PerfTest_2026** › **[Region]** › **[Platform]** › **[Date]**.

Name each file: *Region_Platform_FileSize_RunN_Upload/Download_YYYY-MM-DD.png*. Example:

Europe_Veeva_10MB_Run1_Upload_2026-06-15.png

Saving progress between sessions

The app auto-saves every submitted result to JSONBin cloud. If you need to pause mid-test, click **Save Progress** (top right of Execute Test) — this stores partial data in your browser. When you return, your entries are preserved. **Do not close the browser tab** until you have clicked Submit, as in-progress timer data is not persisted across tab closures.

Generating and sending the results CSV

1. In the left sidebar click **Test Assets**.
2. Click **Export Results CSV**. A file named *QMA_Results_YYYY-MM-DD.csv* downloads to your computer.
3. Open a new email in Outlook.
4. To: **alberto.fumero@fresenius-kabi.com**
5. Subject: **QMA Performance Test Results — [Region] — [Date]**
6. Attach the CSV file and any evidence screenshots.
7. Send the email **at the end of each testing session**, not after each individual run.

For issues with the app or JSONBin connection, contact Alberto Fumero (alberto.fumero@fresenius-kabi.com). Do not modify the HTML file — report any discrepancies by email.
